

APAC Technology Using ConTeXt in Enterprise – Aha! & Gotcha!

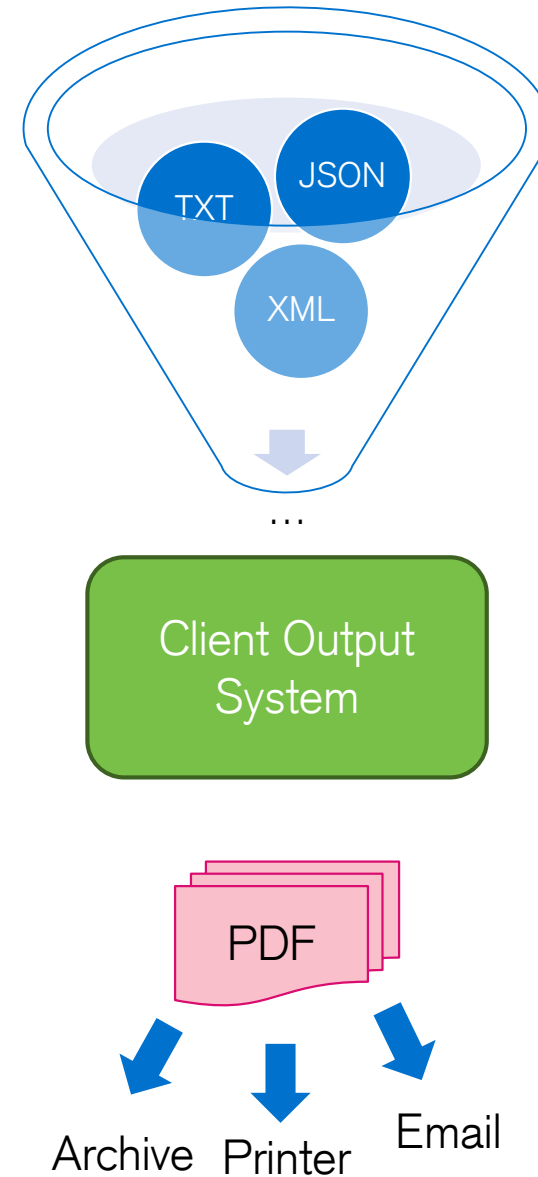

APAC Technology
Sep 2021
V0.1

CREDIT SUISSE 

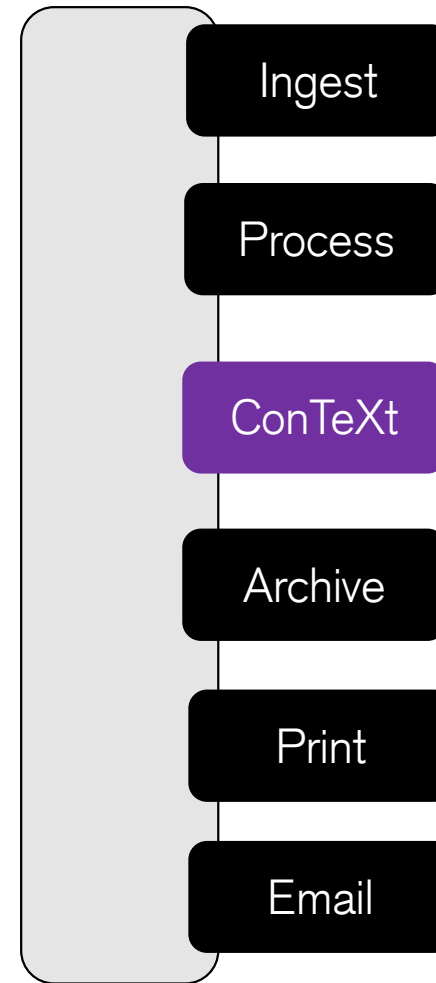

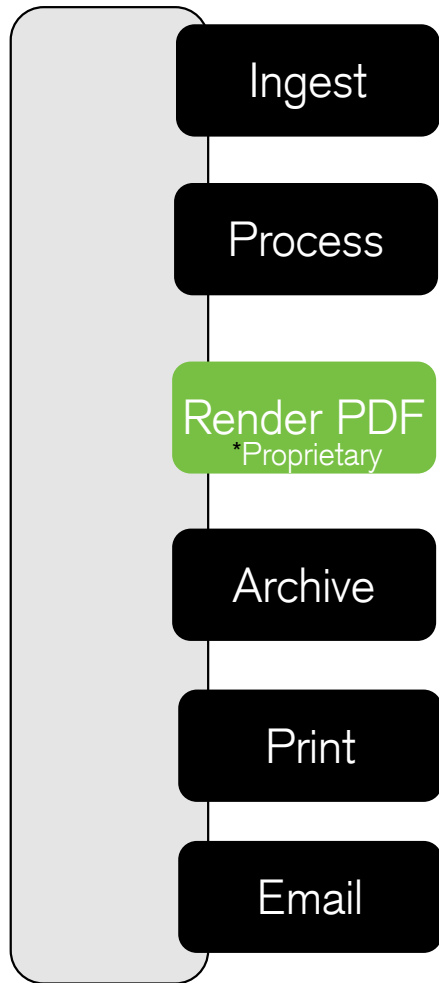

Introduction

- My name is Ramkumar
 - Technical Lead for Client Output System, APAC Technology
 - Write code in Kotlin & Typescript (React) at work
 - These days – Lua & MetaPost also!
 - When am not doing above – learning Rust
- Client Output System
 - 30+ Types of PDF Statements
 - ~ 500k to 700k PDFs monthly
 - PDF Content – Tables, Charts & Line Graphs, Data Viz widgets
 - Single page statement to 300 page statement
 - Batch mode – e.g. ~ 70k PDFs in an overnight batch
 - Online mode - Request / Response (with PDF)

Key Question – Can we use ConTeXt for our usecase?

It has been a 8 month journey thus far...

Elevator Pitch

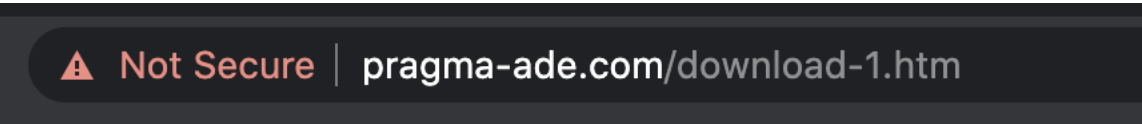

Key Benefits of ConTeXt Engine

- PDF Template as Code
- Whole Community of Users – <https://tex.stackexchange.com>
- Pixel perfect high quality PDF, Automated PDF Form-Filling as a service
- Simple Linux Process, can be scaled out to as many cores/servers as needed
- GNU license

Installation

Gotcha! – blocked, needed a local internal mirror

- Site was blocked internally!

⚠ Not Secure | pragma-ade.com/download-1.htm

- Solution => Internal (manual) mirror
- Sample ConTeXt installer files for Win64:
 - tex/status.tma
 - tex/texmf.tma
 - tex/texmf-context.tma
 - tex/texmf-win64.tma
 - texmf.zip
 - texmf-context.zip
 - tex/texmf-win64/bin/context.exe
 - tex/texmf-win64/bin/context.lua
 - tex/texmf-win64/bin/luametatex.exe
 - tex/texmf-win64/bin/luatex.exe
 - tex/texmf-win64/bin/mtxrun.exe
 - tex/texmf-win64/bin/mtxrun.lua

Do we have to copy all these files with every new release or just the ZIP files?

JSON .. LPEG .. ♥

Gotcha! - `%` in the JSON Data

Thanks to the Lua community, there are many high quality JSON parsers using **lpeg** ♥
Templating with Lua Tables is straightforward...

```
% ===== Read JSON Data =====  
\startluacode  
local json = require("luautils.json")  
local file = io.open(document.arguments.file)  
tab = json.parse(file:read("*all"))  
file:close()  
\stopluacode
```

```
\ctxlua{tex.print(math.floor(tab.sustainabilityGroups[1].weightInPortfolio))}\%
```

Gotcha! - But we have JSON data with `%` symbols (a perfectly valid JSON) –
Pre-process to escape them, so that ConTeXt engine does not throw errors -

```
"description": "3.95 \% BONDS PT BANK RAKYAT INDONESIA (PERSERO) TBK 2019-  
28.03.24 REG S",
```

Tables – Natural Tables (vs XTables)

- `\framed` in ConTeXt ♥ is like `<div class="mt-3 text-lg text-gray-500">`
- Ability to style individual cells in Table turned out to be super important
- Usecases were more for Natural Tables module than xtable

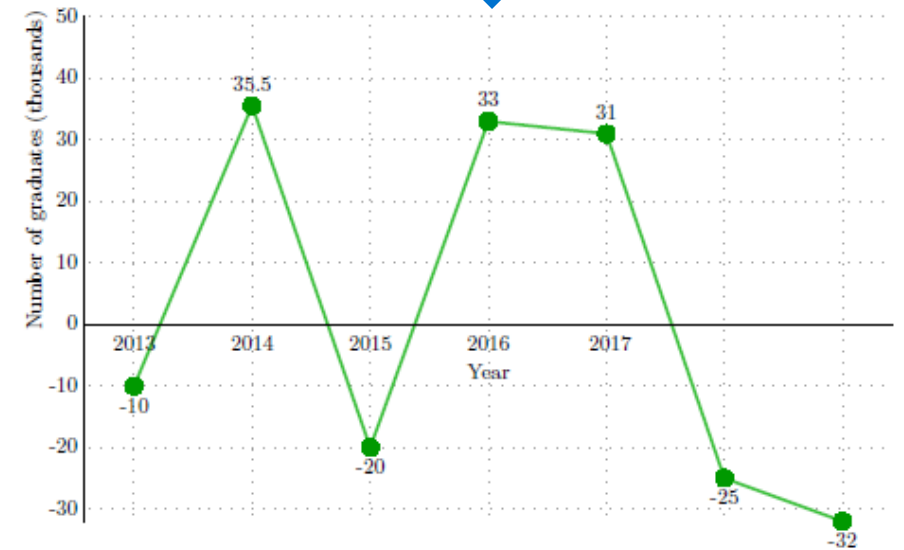

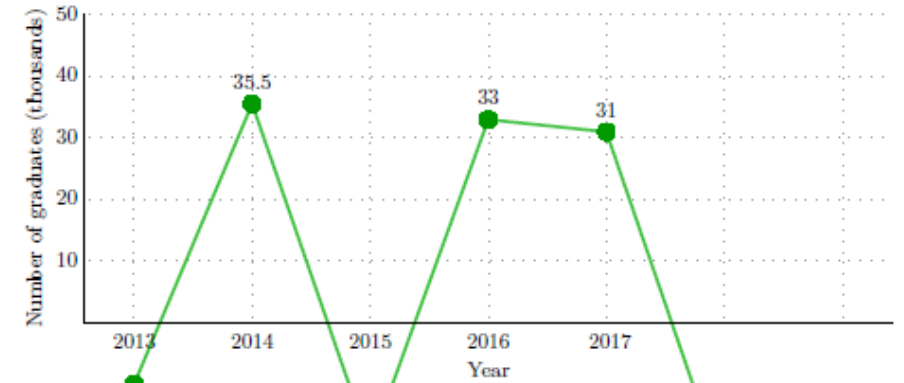

Liquidity	Currencies	Total	Min (%)	Neutral ¹ (%)	Max (%)	Comments ²
	USD		0	0	100	
	EUR					
	SGD					
	Others					

Position	Value in CHF	Weight
 Impact investing Positions that explicitly promote social or environmental goals, adhere to the IFC ² impact principles and report on the impact achieved.	1,234	0%
 Thematic Positions that contribute significantly to the United Nations Sustainable Development Goals (UN SDGs).	2,322	8.00%
Shs -HBC-CHF- N1 Euro Cov Bd Capitalisation	1,000	5.00%

Statistical Charts Module ♥ ♥ ♥

Gotcha! – Negative values are common in Finance!

- Awesome work by the authors - Supports a wide variety of charts
- But patched it to support -ve values (4th Quadrant)
- Could be expanded with new types of Charts – sparklines, linear bubble charts, ...

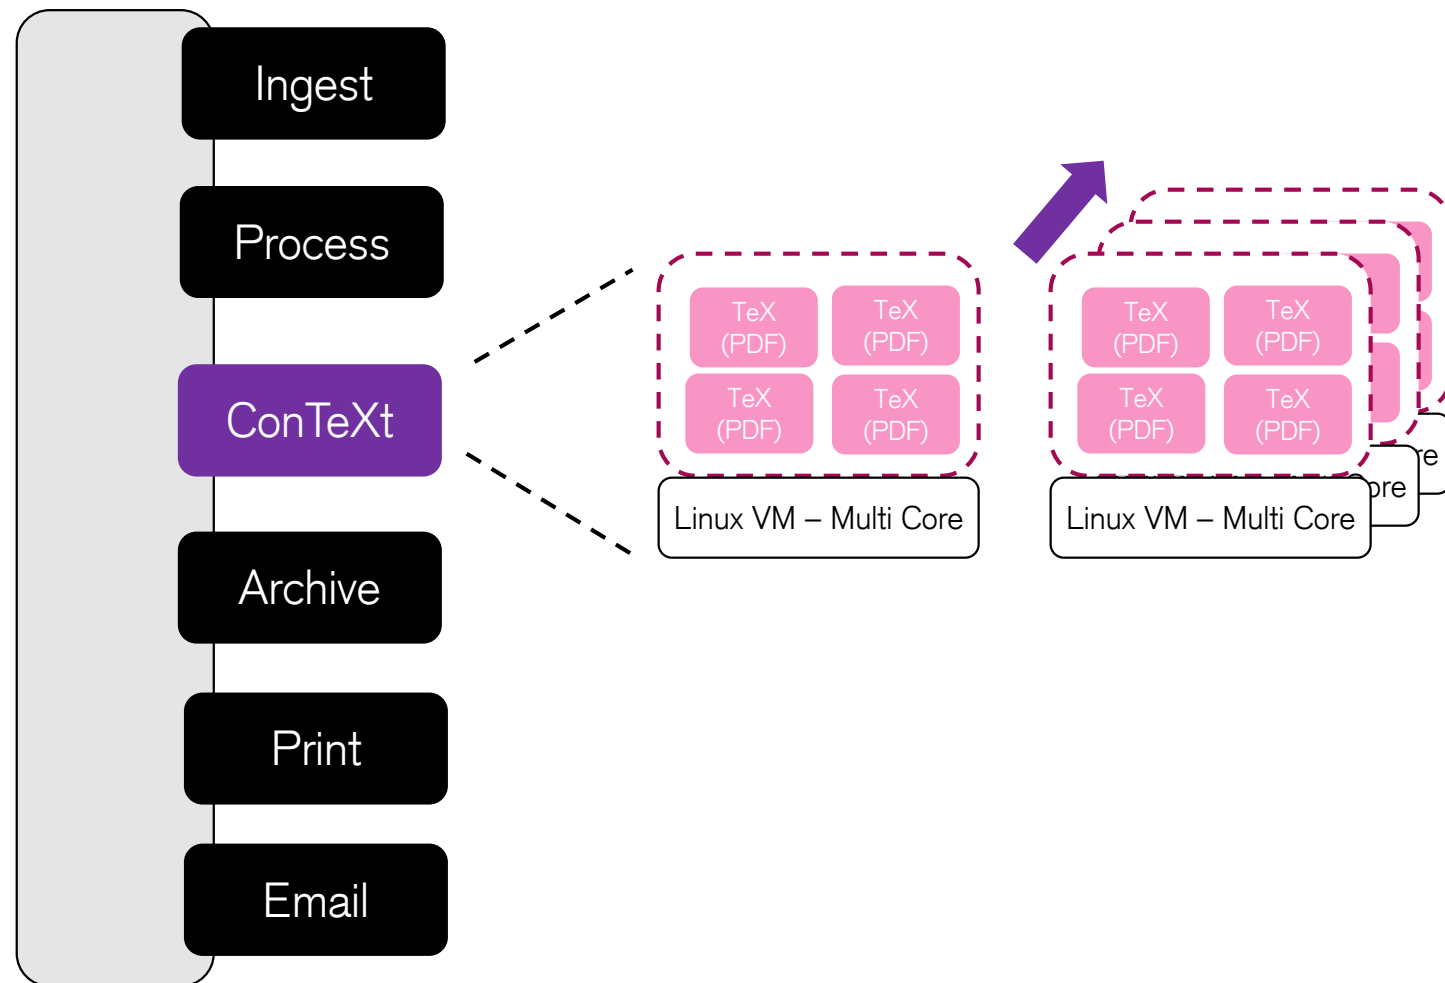

Scale-out with Apache NiFi / GNU Parallel

Scale Out for Batch mode (work in progress)

2 Options being explored -

1. GNU Parallel
2. Apache NiFi

Scale-out with Apache NiFi / GNU Parallel

Work-in-progress

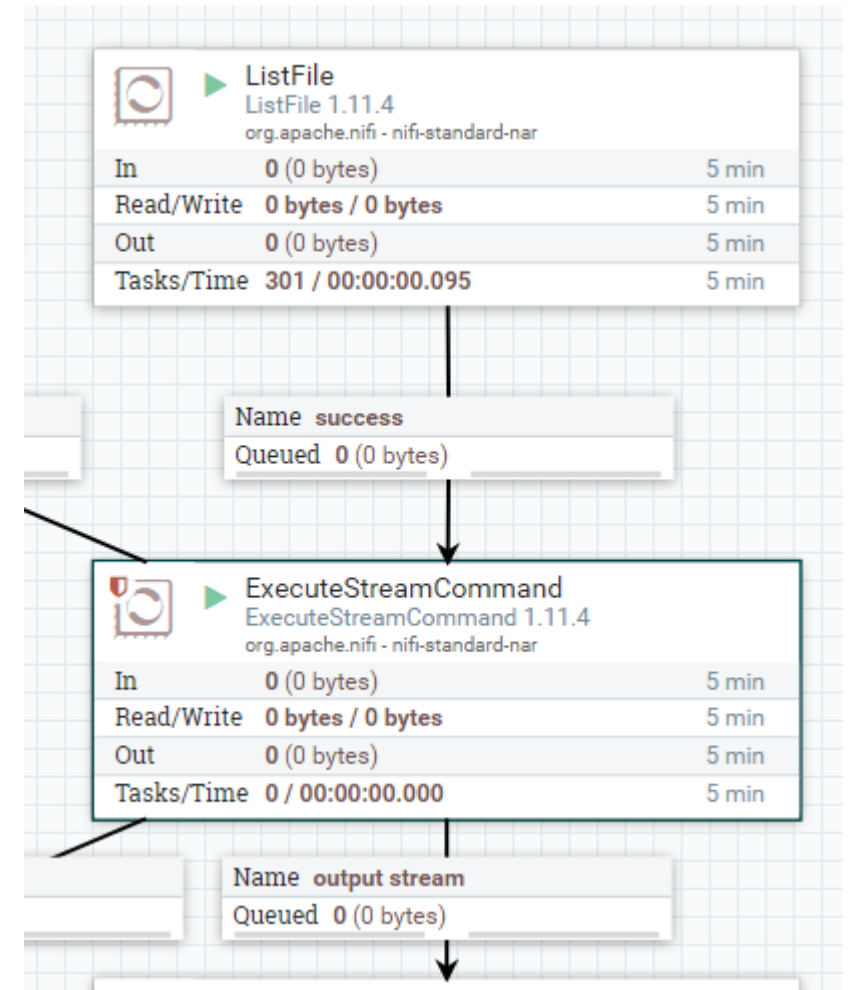

GNU Parallel – Create copies of the TeX file, run them in Parallel and clean up afterwards.

- Error Handling – Should we do inside ConTeXt (e.g. call a Service) or do it outside? How does Parallel report individual file errors?

```
find demo -name \*.json | parallel cp esg-one-pager-clean.tex {/}.tex
find demo -name \*.json | parallel context --file={} --result={/}.pdf --runs=2 --noconsole --batchmode {/}.tex
find demo -name \*.json | parallel mv {/}.pdf output
find demo -name \*.json | parallel rm {/}.log {/}.tuc {/}.tex
```

Running a Batch using **Apache NiFi** Flow files -

- Error Handling – NiFi handles concurrency and reports on any single failure

MetaPost / MetaFun ❤️ ❤️ ❤️ ❤️ ❤️

Turns PDF into a creative canvas !

Thank you Hans / Taco -
`withpattern` in metafun
is pretty cool!

Vitalstatistix allocation by sustainability classifications

- | | |
|---------------------|---------------------|
| 4% Impact Investing | 8% Traditional |
| 13% Thematic | 34% Not sustainable |
| 5% ESG aware | 7% Not classified |
| 20% Avoid harm | 6% Liquidity |

Miscellaneous ❤️

- Unicode support - CJK !
- Test files.zip – Very useful to create training materials
- Add custom PDF Properties
- QRCode library – `qrencode.lua`
- ... a whole lot of stuff that we have not explored
- VSCode as IDE – The extension not fully ConTeXt aware but works
 - This could be a good grad school project to have a ConTeXt aware intellisense for VSCode

Creating an (internal) Training Module

- Installation
- Basics
 - Fonts
 - Layouts
- Basic Lua for Templating with JSON Data
- Natural Tables & XTables
- MetaPost / MetaFun – creating custom data viz
- Charts & Graphs
- Debugging
 - `Underfull \hbox (badness 10000) in paragraph`
 - `Understanding the ConTeXt logs`

Some parting thoughts...

- Section in the ConTeXt wiki on “Security” –
 - What is PDF Security all about?
 - How to check the “health of a PDF” – e.g. no unwanted embedded fonts inside

- What does ConTeXt community think about Tectonic?
 - <https://tectonic-typesetting.github.io/en-US/index.html>
 - Similar to ConTeXt but with Rust
 - New kid on the block?
